

Image filtering

Course announcements

- Updated homework schedule is available on course website.
 - Homeworks released and due every second Wednesday.
 - The homework spanning the spring break will be a half homework.
 - Homework 1 will be available on Wednesday Jan 23rd, and due two weeks from then.
- Homework 0 is available on the course website.
 - This is an *optional* homework to help you familiarize yourselves with Matlab. It does not earn you any credit.
- Make sure you are on Piazza (sign up on your own using the link on the course website).
 - I think I signed up most of you this morning.
 - How many of you aren't already on Piazza?
- Make sure to take the start-of-semester survey (link posted on Piazza).
 - We need your responses to schedule office hours for the rest of the semester.
 - 47 responses (about 50%) as of this morning.
- Office hours **for this week only**:
 - Yannis (Smith Hall Rm 225), Thursday, Friday 4-6 pm.
 - Hours decided based on survey responses so far.

Overview of today's lecture

- Types of image transformations.
- Point image processing.
- Linear shift-invariant image filtering.
- Convolution.
- Image gradients.

Slide credits

Most of these slides were adapted directly from:

- Kris Kitani (15-463, Fall 2016).

Inspiration and some examples also came from:

- Fredo Durand (Digital and Computational Photography, MIT).
- Kayvon Fatahalian (15-769, Fall 2016).

Types of image transformations

What is an image?

What is an image?

A (color) image
is a 3D tensor
of numbers.

What is an image?

color image patch

How many bits are
the intensity values?

red

green

blue

colorized for visualization

actual intensity values per channel

Each channel
is a 2D array of
numbers.

What is an image?

$$f(\mathbf{x})$$

grayscale image

What is the range of the image function f ?

domain $\mathbf{x} = \begin{bmatrix} x \\ y \end{bmatrix}$

A (grayscale) image is a 2D function.

What types of image transformations can we do?

Filtering

changes pixel *values*

Warping

changes pixel *locations*

What types of image transformations can we do?

F

Filtering

$$G(\mathbf{x}) = h\{F(\mathbf{x})\}$$

G

changes *range* of image function

F

Warping

$$G(\mathbf{x}) = F(h\{\mathbf{x}\})$$

G

changes *domain* of image function

What types of image filtering can we do?

Point Operation

point processing

camera output

image after stylistic tonemapping

Many other types of point processing

Linear shift-invariant image filtering

Linear shift-invariant image filtering

- Replace each pixel by a *linear* combination of its neighbors (and possibly itself).
- The combination is determined by the filter's *kernel*.
- The same kernel is *shifted* to all pixel locations so that all pixels use the same linear combination of their neighbors.

Example: the box filter

- also known as the 2D rect (not rekt) filter
- also known as the square mean filter

$$\text{kernel } g[\cdot, \cdot] = \frac{1}{9} \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$

- replaces pixel with local average
- has smoothing (blurring) effect

Let's run the box filter

note that we assume that
the kernel coordinates are
centered

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output
filter
image (signal)

Let's run the box filter

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output k, l filter image (signal)

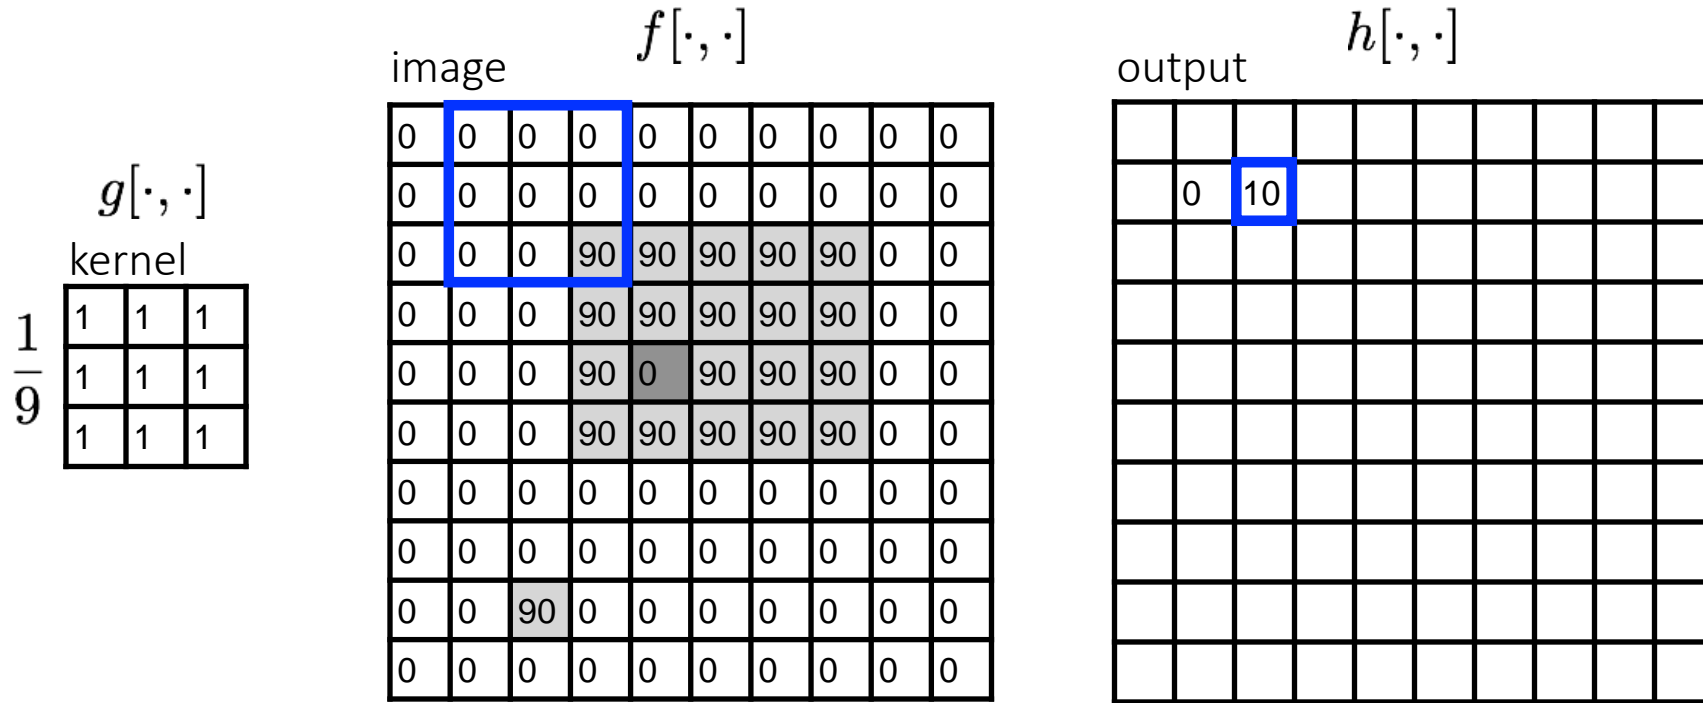

Let's run the box filter

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output filter image (signal)

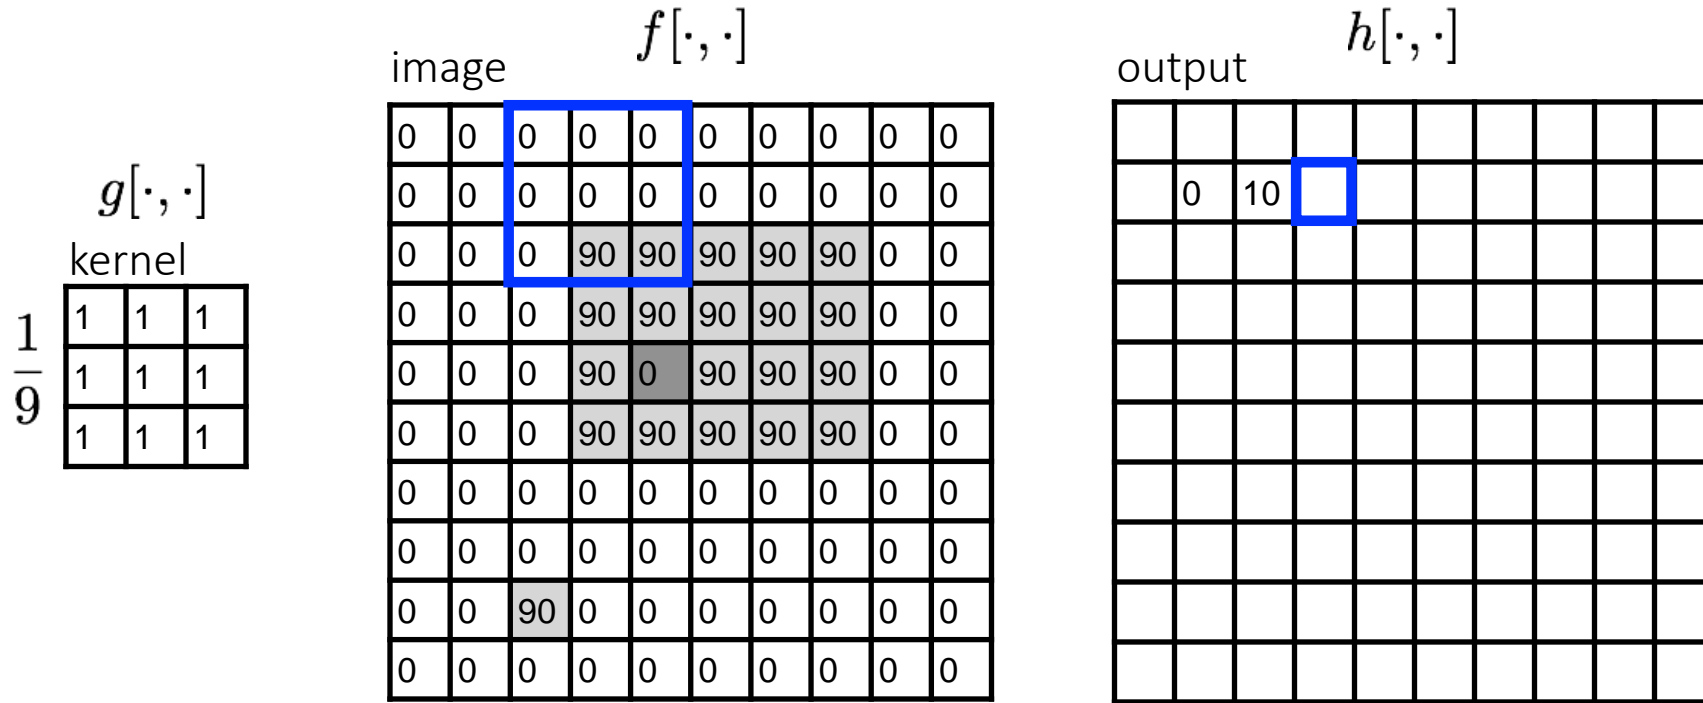

Let's run the box filter

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output
 k, l
filter
image (signal)

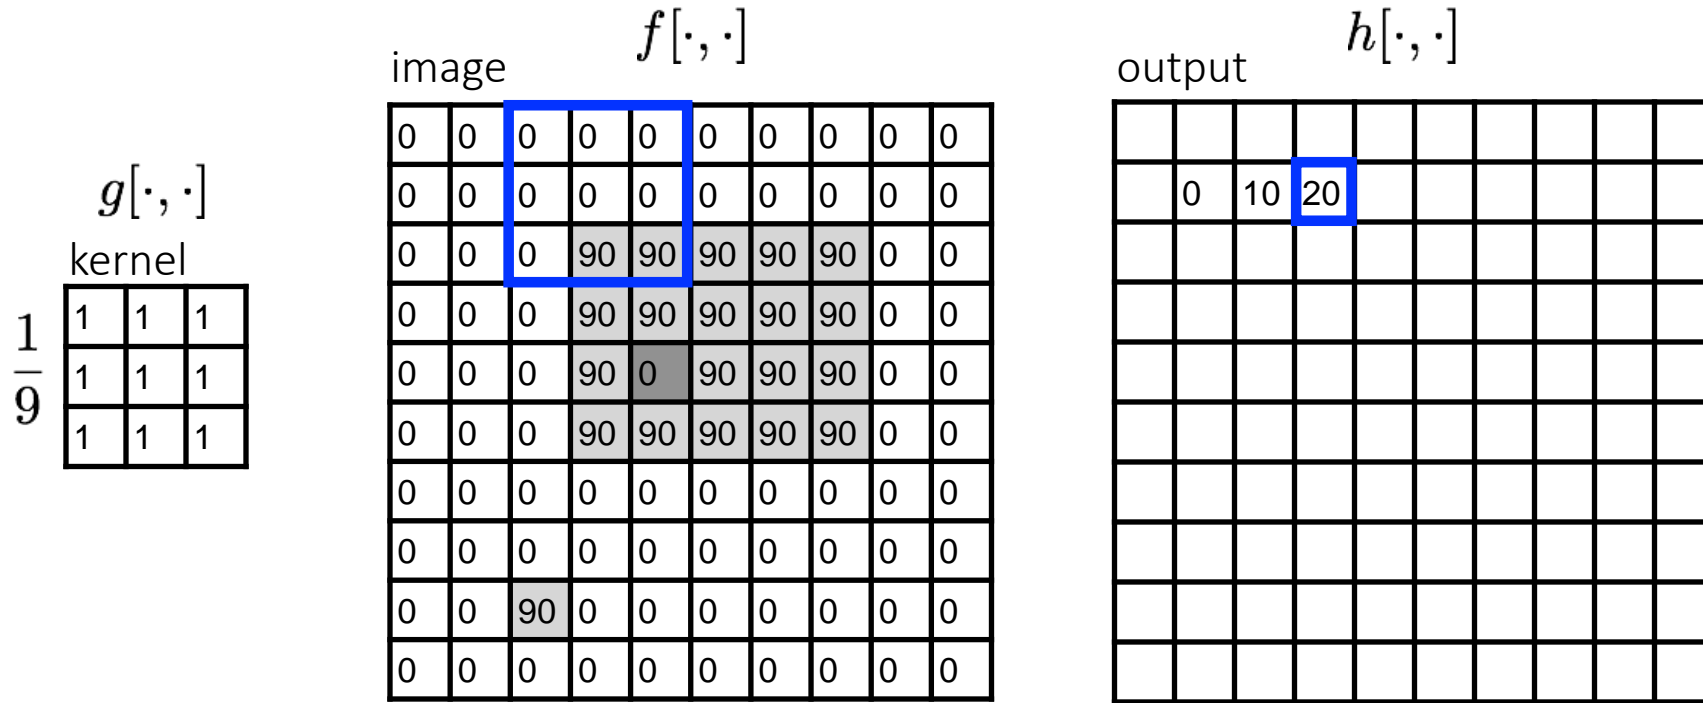

Let's run the box filter

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output k, l filter image (signal)

Let's run the box filter

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output k, l filter image (signal)

Let's run the box filter

Some more realistic examples

Some more realistic examples

Some more realistic examples

Convolution

Convolution for 1D continuous signals

Definition of filtering as convolution:

$$(f * g)(x) = \int_{-\infty}^{\infty} f(y)g(x - y)dy$$

Diagram illustrating the convolution operation:

- filtered signal (points to $(f * g)(x)$)
- filter (points to $f(y)$)
- input signal (points to $g(x - y)$)
- notice the flip (points to the minus sign in $x - y$)

Convolution for 1D continuous signals

Definition of filtering as convolution:

$$(f * g)(x) = \int_{-\infty}^{\infty} f(y)g(x - y)dy$$

filtered signal \nearrow \nwarrow notice the flip \nwarrow filter \nwarrow input signal

Consider the box filter example:

1D continuous
box filter

$$f(x) = \begin{cases} 1 & |x| \leq 0.5 \\ 0 & \text{otherwise} \end{cases}$$

filtering output is a
blurred version of g

$$(f * g)(x) = \int_{-0.5}^{0.5} g(x - y)dy$$

Convolution for 2D discrete signals

Definition of filtering as convolution:

$$(f * g)(x, y) = \sum_{i, j = -\infty}^{\infty} f(i, j) I(x - i, y - j)$$

Diagram illustrating the convolution operation with annotations:

- filtered image**: Points to the result $(f * g)(x, y)$.
- filter**: Points to $f(i, j)$.
- input image**: Points to $I(x - i, y - j)$.
- notice the flip**: Points to the negative signs in the coordinates $x - i$ and $y - j$, indicating the input image is flipped.

Convolution for 2D discrete signals

Definition of filtering as convolution:

$$(f * g)(x, y) = \sum_{i, j = -\infty}^{\infty} f(i, j) I(x - i, y - j)$$

Diagram illustrating the convolution operation with annotations:

- $(f * g)(x, y)$: filtered image (indicated by an arrow from the text "filtered image" to the expression)
- $f(i, j)$: filter (indicated by an arrow from the text "filter" to the expression)
- $I(x - i, y - j)$: input image (indicated by an arrow from the text "input image" to the expression)
- $x - i, y - j$: notice the flip (indicated by an arrow from the text "notice the flip" to the expression)

If the filter $f(i, j)$ is non-zero only within $-1 \leq i, j \leq 1$, then

$$(f * g)(x, y) = \sum_{i, j = -1}^1 f(i, j) I(x - i, y - j)$$

The kernel we saw earlier is the 3x3 matrix representation of $f(i, j)$.

Convolution vs correlation

Definition of discrete 2D convolution:

$$(f * g)(x, y) = \sum_{i, j=-\infty}^{\infty} f(i, j) I(x - i, y - j)$$

notice the flip 

Definition of discrete 2D correlation:

$$(f * g)(x, y) = \sum_{i, j=-\infty}^{\infty} f(i, j) I(x + i, y + j)$$

notice the lack of a flip 

- Most of the time won't matter, because our kernels will be symmetric.
- Will be important when we discuss frequency-domain filtering (lectures 5-6).

Separable filters

A 2D filter is separable if it can be written as the product of a “column” and a “row”.

example:
box filter

1	1	1
1	1	1
1	1	1

=

1
1
1

column

*

1	1	1
---	---	---

row

What is the rank of this filter matrix?

Separable filters

A 2D filter is separable if it can be written as the product of a “column” and a “row”.

example:
box filter

1	1	1
1	1	1
1	1	1

=

1
1
1

column

*

1	1	1
---	---	---

row

Why is this important?

Separable filters

A 2D filter is separable if it can be written as the product of a “column” and a “row”.

example:
box filter

1	1	1
1	1	1
1	1	1

=

1
1
1

column

*

1	1	1
---	---	---

row

2D convolution with a separable filter is equivalent to two 1D convolutions (with the “column” and “row” filters).

Separable filters

A 2D filter is separable if it can be written as the product of a “column” and a “row”.

example:
box filter

1	1	1
1	1	1
1	1	1

=

1
1
1

column

*

1	1	1
---	---	---

row

2D convolution with a separable filter is equivalent to two 1D convolutions (with the “column” and “row” filters).

If the image has $M \times M$ pixels and the filter kernel has size $N \times N$:

- What is the cost of convolution with a non-separable filter?

Separable filters

A 2D filter is separable if it can be written as the product of a “column” and a “row”.

example:
box filter

1	1	1
1	1	1
1	1	1

=

1
1
1

column

*

1	1	1
---	---	---

row

2D convolution with a separable filter is equivalent to two 1D convolutions (with the “column” and “row” filters).

If the image has $M \times M$ pixels and the filter kernel has size $N \times N$:

- What is the cost of convolution with a non-separable filter? $\longrightarrow M^2 \times N^2$
- What is the cost of convolution with a separable filter?

Separable filters

A 2D filter is separable if it can be written as the product of a “column” and a “row”.

example:
box filter

1	1	1
1	1	1
1	1	1

=

1
1
1

column

*

1	1	1
---	---	---

row

2D convolution with a separable filter is equivalent to two 1D convolutions (with the “column” and “row” filters).

If the image has $M \times M$ pixels and the filter kernel has size $N \times N$:

- What is the cost of convolution with a non-separable filter? $\longrightarrow M^2 \times N^2$
- What is the cost of convolution with a separable filter? $\longrightarrow 2 \times N \times M^2$

any problems
in this image?

The Gaussian filter

- named (like many other things) after Carl Friedrich Gauss
- kernel values sampled from the 2D Gaussian function:

$$f(i, j) = \frac{1}{2\pi\sigma^2} e^{-\frac{i^2+j^2}{2\sigma^2}}$$

- weight falls off with distance from center pixel
- theoretically infinite, in practice truncated to some maximum distance

Any heuristics for selecting where to truncate?

The Gaussian filter

- named (like many other things) after Carl Friedrich Gauss
- kernel values sampled from the 2D Gaussian function:

$$f(i, j) = \frac{1}{2\pi\sigma^2} e^{-\frac{i^2+j^2}{2\sigma^2}}$$

- weight falls off with distance from center pixel
- theoretically infinite, in practice truncated to some maximum distance

Any heuristics for selecting where to truncate?

- usually at $2-3\sigma$

Is this a separable filter?

Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?

Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?

✓ You take derivatives: derivatives are large at discontinuities.

How do you differentiate a discrete image (or any other discrete signal)?

Detecting edges

How would you go about detecting edges in an image (i.e., discontinuities in a function)?

- ✓ You take derivatives: derivatives are large at discontinuities.

How do you differentiate a discrete image (or any other discrete signal)?

- ✓ You use finite differences.

Finite differences

High-school reminder: definition of a derivative using forward difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Finite differences

High-school reminder: definition of a derivative using forward difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Alternative: use central difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+0.5h) - f(x-0.5h)}{h}$$

For discrete signals: Remove limit and set $h = 2$

$$f'(x) = \frac{f(x+1) - f(x-1)}{2}$$

What convolution kernel does this correspond to?

Finite differences

High-school reminder: definition of a derivative using forward difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

Alternative: use central difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+0.5h) - f(x-0.5h)}{h}$$

For discrete signals: Remove limit and set $h = 2$

$$f'(x) = \frac{f(x+1) - f(x-1)}{2}$$

- How are the other filters derived and how do they relate to the Sobel filter?
- How would you derive a derivative filter that is larger than 3x3?

Computing image gradients

1. Select your favorite derivative filters.

$$S_x = \begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

$$S_y = \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

Computing image gradients

1. Select your favorite derivative filters.

$$\mathbf{S}_x = \begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

$$\mathbf{S}_y = \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

2. Convolve with the image to compute derivatives.

$$\frac{\partial f}{\partial x} = \mathbf{S}_x \otimes f$$

$$\frac{\partial f}{\partial y} = \mathbf{S}_y \otimes f$$

Computing image gradients

1. Select your favorite derivative filters.

$$\mathbf{S}_x = \begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

$$\mathbf{S}_y = \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

2. Convolve with the image to compute derivatives.

$$\frac{\partial \mathbf{f}}{\partial x} = \mathbf{S}_x \otimes \mathbf{f}$$

$$\frac{\partial \mathbf{f}}{\partial y} = \mathbf{S}_y \otimes \mathbf{f}$$

3. Form the image gradient, and compute its direction and amplitude.

$$\nabla \mathbf{f} = \left[\frac{\partial \mathbf{f}}{\partial x}, \frac{\partial \mathbf{f}}{\partial y} \right]$$

gradient

$$\theta = \tan^{-1} \left(\frac{\partial \mathbf{f}}{\partial y} / \frac{\partial \mathbf{f}}{\partial x} \right)$$

direction

$$\|\nabla \mathbf{f}\| = \sqrt{\left(\frac{\partial \mathbf{f}}{\partial x} \right)^2 + \left(\frac{\partial \mathbf{f}}{\partial y} \right)^2}$$

amplitude
